Exercise 1: Importing

Goal

Get comfortable with different ways of importing objects from a package.

Tasks

0. [if not done already] clone the repository
   https://github.com/pamelahathway/organising-code

1. Import the module `brew_potions.py` in the `example_usage_outside_package.py` file:
   1. import only the `make_example_potion` function and call it
   2. import all the objects in the module and call the `make_example_potion` function
   3. change the import statement so that you can call the `make_example_potion` function like this:
      `br.make_example_potion`

2. In the `scripts` folder, there is a file called `example_usage_different_folder.py`. Try to import the `make_example_potion` function from there.
   1. does it work?
   2. If yes, why? If no, why not?

3. Run the file `example_usage_inside_package.py` within the brewing package. Does it work?
